

## COMPETITION >> NET NEUTRALITY

Net neutrality is driven by the principle that all information flowing across the internet should be treated equally. The counter-argument focuses on possible disincentive to invest because of free-riding and network congestion caused by data rich applications. Some of the solutions suggested include:

- ✓ Multi-tiered access
- ✓ Fee differentiation for content providers

However, the appropriate net neutrality regulation must be well-conceived through a thorough examination of economics, policy-objectives, and market conditions.
